

# Working at TPG Maritime: Senior Project Engineer

TPG Maritime's atmosphere management systems enable people to live and work safely for extended periods below sea - each system bespoke to the customer's requirements. The complexity of each project means that the systems can take several years to complete.

## Delivering the Senior Project Manager role

In his role as Senior Project Manager, Dave has the responsibility for delivering the bespoke multi-million-pound project. What's particularly challenging is that there isn't an opportunity to pilot build the complex systems. The equipment needs to be right first time hence an extensive manufacturing process involving rigorous testing and commissioning.

Dave oversees multiple projects, working with the resource managers to ensure the necessary resources, estimate project budgets, set project scopes and schedules, and wrap this information into project plans. He is responsible for the strategic direction of projects and that they align with organisational strategy and priorities.

His involvement covers the whole project from the bid process through to the end delivery to the customer. He believes that the success of projects is down to people and processes - enjoying building great technical teams that communicate well and motivating them to hit project milestones.

Said Dave: *"I love the challenge this role provides – it's a dynamic environment that encourages you to constantly improve how we do things – supported by a business focussed on bringing in a lean approach and ever greater personal development. I'm proud to be working for a UK manufacturing business that seeks to source from a UK supply chain where possible. It's one of the reasons that attracted me to the role."*
